

# Counting Inversions- Divide and Conquer

# Counting Inversions

- Music site tries to match your song preferences with others.
  - You rank  $n$  songs.
  - Music site consults database to find people with **similar** tastes.
- Similarity metric: number of inversions between two rankings.
  - My rank:  $1, 2, \dots, n$ .
  - Your rank:  $a_1, a_2, \dots, a_n$ .
  - Songs  $i$  and  $j$  **inverted** if  $i < j$ , but  $a_i > a_j$ .

*Songs*

	A	B	C	D	E
Me	1	2	3	4	5
You	1	3	4	2	5

Inversions

3-2, 4-2

# Counting Inversions

Two elements  $a[i]$  and  $a[j]$  form an inversion if  $a[i] > a[j]$  and  $i < j$

a	0	1	2	3	4	<u>Inversions</u> (2,1), (4,1),(4,3)
	2	4	1	3	5	

Inversion Count for an array indicates: How far (close) the array is from being sorted  
if array is already sorted inversion count is ??

if array is sorted in reverse order that inversion count is the ???

# Visualizing inversions

**# test all pairs**

**c=0**

**for i in 0 to n-1**

**for j in i+1 to n-1**

**compare  $r_i$  and  $r_j$**

**if inversion c++**

Naive algorithm

# Counting Inversions: Divide-and-Conquer

- Divide-and-conquer.

1	5	4	8	10	2	6	9	12	11	3	7
---	---	---	---	----	---	---	---	----	----	---	---

# Counting Inversions: Divide-and-Conquer

- Divide-and-conquer.
  - **Divide**: separate list into two pieces.

1	5	4	8	10	2	6	9	12	11	3	7
---	---	---	---	----	---	---	---	----	----	---	---

Divide:  $O(1)$ .

1	5	4	8	10	2	6	9	12	11	3	7
---	---	---	---	----	---	---	---	----	----	---	---

# Counting Inversions: Divide-and-Conquer

- Divide-and-conquer.
  - Divide: separate list into two pieces.
  - **Conquer**: recursively count inversions in each half.

Divide:  $O(1)$ .

Conquer:  $2T(n/2)$

5 blue-blue inversions

8 green-green inversions

5-4, 5-2, 4-2, 8-2, 10-2

6-3, 9-3, 9-7, 12-3, 12-7, 12-11, 11-3, 11-7

# Counting Inversions: Divide-and-Conquer

- Divide-and-conquer.

- Divide: separate list into two pieces.
- Conquer: recursively count inversions in each half.
- **Combine**: count inversions where  $a_i$  and  $a_j$  are in different halves, and return sum of three quantities.

Divide:  $O(1)$ .

Conquer:  $2T(n/2)$

5 blue-blue inversions

8 green-green inversions

9 blue-green inversions

5-3, 4-3, 8-6, 8-3, 8-7, 10-6, 10-9, 10-3, 10-7

**Combine**: ???

Total =  $5 + 8 + 9 = 22$ .

# Counting Inversions

Divide into front and back halves

Count inversions within each half, and sort each half

Then, count inversions between front and back half

# Counting Inversions: Implementation

---

Sort-and-Count( $L$ )

    If the list has one element then  
        there are no inversions

Else

    Divide the list into two halves:

$A$  contains the first  $\lceil n/2 \rceil$  elements

$B$  contains the remaining  $\lfloor n/2 \rfloor$  elements

$(r_A, A) = \text{Sort-and-Count}(A)$

$(r_B, B) = \text{Sort-and-Count}(B)$

$(r, L) = \text{Merge-and-Count}(A, B)$

Endif

Return  $r = r_A + r_B + r$ , and the sorted list  $L$

---

# Counting Inversions: Implementation

---

Merge-and-Count( $A, B$ )

Maintain a *Current* pointer into each list, initialized to point to the front elements

Maintain a variable *Count* for the number of inversions, initialized to 0

While both lists are nonempty:

Let  $a_i$  and  $b_j$  be the elements pointed to by the *Current* pointer

Append the smaller of these two to the output list

If  $b_j$  is the smaller element then

Increment *Count* by the number of elements remaining in  $A$

Endif

Advance the *Current* pointer in the list from which the smaller element was selected.

EndWhile

Once one list is empty, append the remainder of the other list to the output

Return *Count* and the merged list

# Counting Inversions

- Merge and count step.
  - Given two sorted halves, count number of inversions where  $a_i$  and  $a_j$  are in different halves.
  - Combine two sorted halves into sorted whole.

$i = 6$
